

Varnish Test Kit

Clickfit is introducing a varnish test kit to help with EHV and highstress cable installations.

Problem

For EHV and high-stress systems the cable preparation becomes very important. Post-preparation checking for miniscule scratches and imperfections is not possible using the naked eye.

Our solution

The Varnish Test Kit. This test determines if any scratches are present on the cable after the final cable preparation step. The Varnish Test Kit comes with necessary material and consumables to perform the test.

Chamfer preparation check tool

Clickfit is introducing a cable preparation tool to make a quick and foolproof check on the cable preparation.

Problem

During the cable preparation a radius is required on the edge of the insulation. The size of the radius is not easy to verify.

Our solution

The check tool is a one size fits all for all voltage classes between 110kV - 550kV. The tool is used to ensure proper cable and preparation.
